You'll get a comfortable headphones and sound system without breaking the bank. Who's that for? Those on a tighter budget who still want the convenience of a wireless model. Why we chose the PDP Afterglow AG 9: PDP Afterglow AG 9 is a solid helmet that manages to make an impression without breaking the bank. Thanks to the detachable design of the microphone, the AG 9 can even work well as well as a simple pair of headphones, handling both music and gameplay well. The mix can sometimes be a bit top-heavy, but the AG9 is a great audio device overall. Unlike some wireless headphones, there is little or no annoying wireless buzzing, which is especially welcome during quieter times. It must be admitted that the aesthetic is far from subtle. The quality of construction is top notch, a heaviness and robustness that is not usually found in headphones at this price range. We also like simple and intelligently placed controls in volume and microphone. Perhaps most important is the comfort of headphones and bandeau padding. The cushioned areas feel more like soft fabric upholstery than thin leather or polyester. Solid padding is crucial for these marathon game sessions, and we could play for hours wearing these. On this subject, subject, The PDP Afterglow AG 9 offers more than 15 hours of battery life, which is an impressive charge for any wireless device. There's also cool customizable LED lighting on the outside to make it look like you're straight out of Tron. Honestly, light effects are what every serious (and not so serious) player wants. How we test as we do for all the products we test, we put game helmets through the spinner. We judge based on the audio performance, microphone performance and portability of a headset. Assessing battery life and wireless connectivity, if any, is also part of the runoff. We play games of different sound experiences for a thorough sound check. Our audio checklist to explore ensures that headphones will sound great during action-heavy gameplay and in quieter sections. We also listen to non-gaming audio and videos, including a selection of music from different genres at different bit rates. By checking the specifications of the headsets with a range of audio types, we can discern whether the headsets work well outside of a gaming context. To test the microphones, we sing clips of ourselves speaking in quiet and noisy environments, both with any cancelling noise or upgrades switched on and off. We use headphones over several days, wearing them during the game, watching videos, or listening to music to test the veracity of battery life claims. At the end of the day, we also want to assess their long-term portability and comfort. If you're in the market for a new PS4 headset, our recommendations are your best bet. Editors' recommendations
